

30.10.12

* Use try catch block

For input, `BufferedReader` class

For output, `PrintWriter` class

```
BufferedReader br = new BufferedReader(new InputStreamReader(  
    socket.getInputStream()));
```

```
PrintWriter pr = new PrintWriter(socket.getOutputStream());
```

SMTP port : 25, 587

server: webmail.buet.ac.bd

Wireshark

- arp -a

Address Resolution Protocol

- ping

* 248.0 : same network between two devices.

- tracer ip-address

ping -a ¹⁹²
168.168.0.103

// Resolve host name

20.11.18

2	5	3
3	3	3
4	4	3

Cost to reach from 1

Routers

But routing table doesn't have the info about shortest path.

Routing table for 1

Routing table for 3

2	10	2
3	3	3
4	-	-

1	3	1
2	2	2
4	11	4

Routing table for 2

Routing table for 4

1	10	1
3	2	2
4	4	4

1	-3	4-
2	2	2
4	11	4

So, one router sends its routing table to its immediate router, and updates accordingly.

Distance vector routing.

IP and weight of every edges are in topo.txt

*** We can ^{only} extract info about neighbour from topo.txt

** We can't modify driven.py .

Driven can change link cost
up
down

command a router to show its routing table
command a router to send message

Commands

\$ ifconfig

shows interface, IP,

* driven always runs in IP ~~168~~. 192. 168. 100.

split → to divide the terminal .

\$ show <ip>

\$ send <ip> <ip> n message
src dst msglen

* Driven sends message byte by byte

- * Cross cable for connecting between similar devices
- * Straight cable for connecting between dissimilar devices.
- Uplink → for connecting with other switch or other room.
~~not with~~

- └ Core layer
- └ Distribution layer
- └ Access layer → In room

• Putty → software

• CLI → Common Line Interface

• Console → Wire of

• TIA 568 568

• IOS → Internetworking Operating system.

> #
└ Privilege mode
└ User / View mode

• RIP → Routing Information Protocol

{ ISIS → Intermediate System Intermediate System (less popular)
└ OSPF → Open SPF (more popular)

• IETF → Internet Engineering Task Force

• DHCP

192.168.43.3

This 24 bits are same in all devices under same network.

↓
Subnet address

subnet mask 255.255.255.0

AND ing IP address with $111 \dots 1_{24} 000 \dots 0_8$, we get
network address

** IP Header

** Frame header

Commands

> enable

show version

show flash

show ip interface brief

** { g 0/0 gigabyte (for router to device)
 s 0/0/0 Serial (for router to router)

* DORA → 4 messages are exchanged in DHCP

~~#~~ ping icmp

IP unreliable protocol

ICMP	echo	request
ICMP	echo	reply

enable configure terminal

show run * *

RAM NVRAM

Copy ~~run~~ start

no shutdown

arp — address resolving protocol

... clock ...
