

Every router maintains a routing table

অন্য node (router) এর কাছে কত cost এ পৌঁছানো যায়।

→ Per router knows, how many routers are there in the network.

Next কোন hop এ যেতে হবে তার info ও রাখতে হবে।

Routing table has to be dynamically generated as a new router can be added inside the network.

→ Per router knows → who are the neighbours and কত cost এ সেই neighbour এ যাওয়া যায়

Per router certain time পরপর তার table neighbour কে পাঠাবে so ↓

3, 2 কে বলে (3→1) যাওয়া যায় 3 cost
2 জানে (2→3) cost হল 2 and ∴ (2→1) = 10
(2→1) cost update করে 10 হতে (2+3)=5 হবে

Unix Virtual Interface

4 Virtual Interface \rightarrow each having an ip and port.

topo.txt having per end's ip and edge weight

\downarrow

Who are the neighbours and what is the cost to reach
it's number

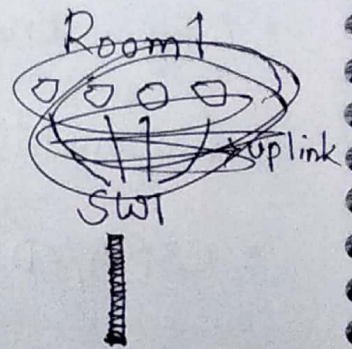

\rightarrow ifconfig

Switch (24 port each)

- Cross cable (Used between two same devices)
Transmitter — receiver

Same device (Switch)

Same device (Switch)

up link → means অন্য জায়গায়
→ larger line needed

Access layer (Room)
 ↑
 Distribution layer (Floor)
 ↑
 Core layer (Building)
 ↑
 Main line

two end
 similar
 UTP
 category 5

Practical:

Router ← Console → (PC via serial port)
 via through

↓
 Putty software

(Give ip of router here)

Virtual:

Command Line Interface (Command Prompt of packet
 tracer)

IOS = Inter Networking Operating System

*

> = view mode

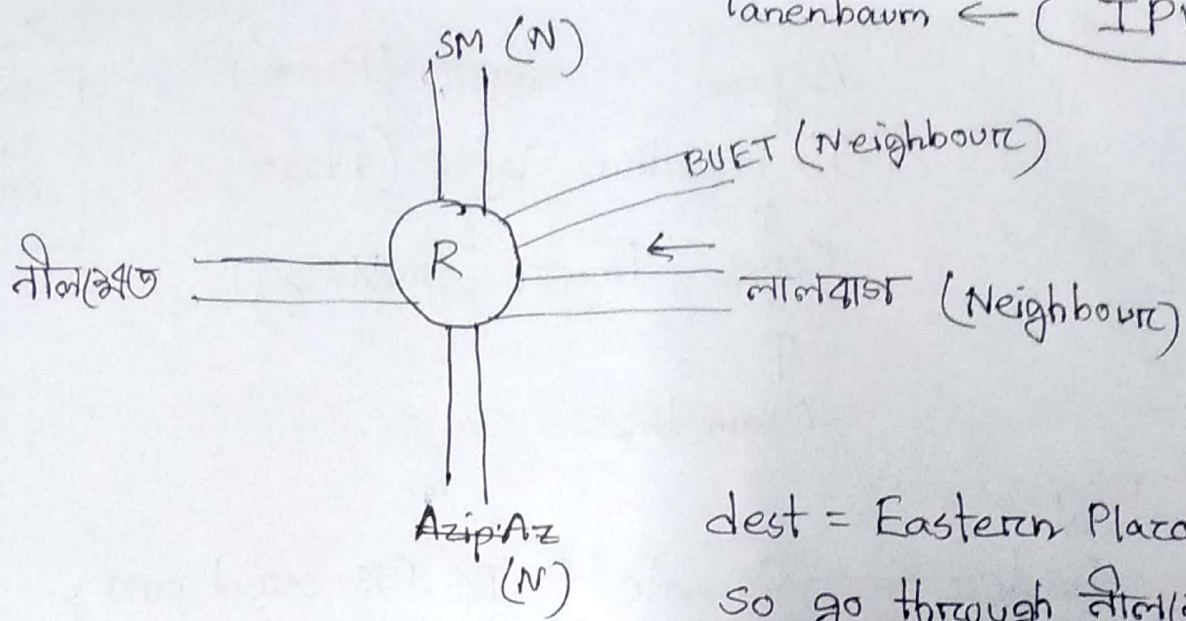

→ privilege mode

enable (Go to user & view to privilege mode)

Toroaid

Tanenbaum ← (IPV4)

dest = Eastern Plaza
so go through ନୀଳଭାଟ

if dest = Motigheel then
follow SM but if SM
is block then best option
is BUET.

Routing info. protocol (RIP)
EIGRP (Distance Vector Routing Protocol)
OSPF (Open Shortest Path first)
ISIS (Intermediate System -
Intermediate System)

IETF (Internet Engineering
Task Force)

DHCP (Dynamic Host Configuration Protocol)

dest.	Next Hop

Subnet Mask
Same network ଓ. ବି
24 bit same

192.168.43.1 → Don't Care
Subnet Mask
Net → Host

Filtering ↓

192.168.43.1

& 1111 ——— 1 0000 ——— 0
24 8

192.168.43.0 → Network Address

Broadcast address

Header for L3

IP header

→ Source IP :

→ Dest IP :

~~Port~~ RS232 - Serial Port

Router → HWIC-2T to a port

আগে off করে নিতে হবে।

Class C Network:

Host 8 bit + Net 24 bit

16 + 16 = Class B

8 + 24 = " A

Broadcast: ~~250~~ 255 (43.255)

(সববার কাছে পাঠানো)

→ last 8 bit all 1

Default Gateway :

OS corrupted

flash0:c2900
→ এখানে OS loaded আছে
> enable

show version

show flash

show ip interface brief

Port এর অবস্থা
দেখা যায়

g0/0 } Gigabit 0/0
0/1 } 0/1
s0/0 } serial 0/0
0/1 } 0/1

Toroaid

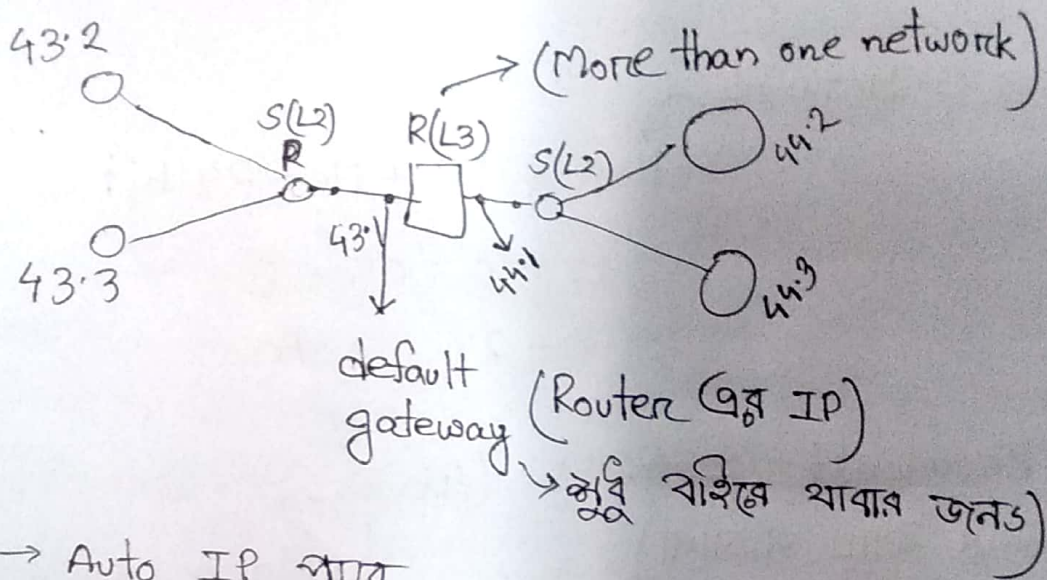

Router — Router

L2 → No IP

Serial port দ্বারা

Sw — Router

Gigabit port দ্বারা

DHCP → Auto IP পাব

↳ DORA msg exchange করে
Discover offer

Ping : Internet Control Msg Protocol (ICMP) Can do connectivity test

IP is an unreliable protocol

Packet গুলি কীনা ensure করে না

ICMP echo request → 1st packet যা যাবে
" " reply → যেই packet ফেরত আসে

→ ip address (ip) (submask) ~~ip~~:

show run } current operating configuration

RAM → volatile

NVRAM → Non-volatile

copy run start

↳ starting configuration
↳ running configuration

run config file ko startup config shikhe NVRAM e
load hbe

Router restart

↓
OS Load

↓
find startup

↓
copy

↓
take it into running config

ARP resolution এর জন্য timeout হয়।

* show run

|
space

|
space

} Previous command
গুলো ~~দেখ~~ show
করে

Toroaid

Show ip route

c = connected

New Network

↓
Give me

For Router 1

→ clock rate 64000

→ no shutdown

For Router 2

→ no shutdown

Why drop

43.3 → 44.3

R1 এর কাছে 43.1 and 45.1 আছে

so 44.3 কে recognize করতে পারে না।

Dynamic Routing:

router rip

network 43.0

network 45.0

} Give in Router 1's config mode

R1 তার সাথে connected অবস্থাকে জানাতে চায়-

so other networks know this network belongs to

R1.

Static → type in router1

ip route 192.168.44.0 subnet mask ~~0.0.0.255~~ ~~serial~~^s 0/0/0

for router2

ip route 192.168.43.0 subnet mask ~~0.0.0.255~~ ~~serial~~^s 0/0/0
